

# AI in Business Valuation

Business Analysis and Valuation

# How AI can help: What changes, what doesn't

- Valuation theory: unchanged
  - DCF, multiples, cost of capital, terminal value
- What changes: how inputs get built, checked

# How AI Has Evolved: From Prompts to Agents

- 2023: prompt-based AI — a human asks, the model answers
  - Single-turn chat responses; every next step needs a fresh instruction from a person
- Today: agentic AI — the model plans and acts
  - Breaks a goal into steps, calls tools and data sources, checks its own output, and keeps going without a prompt for every step
- Why it matters for valuation work
  - Multi-step tasks — sourcing peer data, building comps, updating models — can now run with far less manual back-and-forth

## DCF Valuator

DCF expert comparing projected and actual values.

Compute Apple's  
DCF valuation

Compare derived  
and actual  
enterprise values ...

Detail free cash  
flow calculations  
for Apple

Generate a

Force the model to write the Python code (or code in some other language) and show the computations for FCF.

## Agentic AI Workflow: Valuing a Company

*Steps run largely on their own — and after scenarios are built, the agent can loop back to source more data before projecting.*

# Using AI to find the Peers

- Screening: AI scans filings and business descriptions to surface candidate peers
  - NLP compares product mix, geography and customers, going beyond static SIC/GICS codes
- Clustering: machine learning groups companies by growth, margin and risk profile
  - Flags peers with similar economic drivers even across different industry labels
- Continuous refresh: the peer set updates automatically as business mix or markets shift
  - Stale comps drop out and newly relevant entrants are flagged for review

# AI in Action: Finding Peers for Maruti Suzuki

**Prompt used:** “Find the closest listed peers to Maruti Suzuki India for relative valuation — same industry, product segment overlap, and similar growth/margin profile. Return names with forward P/E, market cap, and growth.”

| Company             | Segment             | Fwd P/E | Market Cap | Est. Growth |
|---------------------|---------------------|---------|------------|-------------|
| Maruti Suzuki India | Mass-market PV      | 33.8x   | ₹5.0T      | 14.8%       |
| Mahindra & Mahindra | SUV / UV, Tractors  | 29.5x   | ₹4.2T      | 11.7%       |
| Hyundai Motor India | Mass-market PV      | 33.1x   | ₹1.9T      | 15.0%       |
| Tata Motors (PV)    | Mass-market PV / EV | 11.7x   | ₹1.3T      | -8.9%       |
| Bajaj Auto          | Two/three-wheelers  | 30.4x   | ₹2.5T      | 12.7%       |

# Warren AI (from Investing.com): Finding Peers for Maruti Suzuki

**Prompt used:** Find the peer companies for Maruti Suzuki India Limited. And then compare them with Western, their valuation multiples. Prepare a final table to summarize the data.

| Company                                                | Market Cap | P/E (LTM) | EBITDA Margin | Revenue Growth | ROE   |
|--------------------------------------------------------|------------|-----------|---------------|----------------|-------|
| <a href="#">Maruti Suzuki India Limited</a>            | ₹4.30T     | 25.9x     | 11.7%         | 19.9%          | 14.4% |
| <a href="#">Mahindra Mahindra Limited</a>              | ₹3.82T     | 21.0x     | 18.6%         | 25.4%          | 20.1% |
| <a href="#">Tata Motors Passenger Vehicles Limited</a> | ₹1.19T     | 30.1x     | 3.9%          | -8.1%          | -1.4% |
| <a href="#">Hyundai Motor India Limited</a>            | ₹1.78T     | 25.0x     | 12.3%         | 2.3%           | 29.9% |

| Company | Market Cap | P/E (LTM) | EBITDA Margin | Revenue Growth | ROE |
|---------|------------|-----------|---------------|----------------|-----|
|---------|------------|-----------|---------------|----------------|-----|

|    |                                           |            |           |               |                |       |
|----|-------------------------------------------|------------|-----------|---------------|----------------|-------|
| S  | Company                                   | Market Cap | P/E (LTM) | EBITDA Margin | Revenue Growth | ROE   |
| Ir | <a href="#">Bajaj Auto Limited</a>        | ₹3.19T     | 27.6x     | 23.6%         | 22.7%          | 29.0% |
| S  | <a href="#">Hero MotoCorp Limited</a>     | ₹1.15T     | 18.6x     | 14.4%         | 15.9%          | 28.1% |
| B  | <a href="#">TVS Motor Company Limited</a> | ₹2.07T     | 55.4x     | 14.0%         | 26.9%          | 33.4% |

## EPS can include one-off gains: **Example: Alphabet's EPS**

- Q2 2026 diluted EPS: \$9.11 (GAAP)
- \$99B: unrealized gains, SpaceX + Anthropic stakes
- Adjusted EPS: \$2.85 — missed \$2.89 consensus

## Example: Anthropic's multiple

- Valuation: \$965B (Series H, May 2026)
- Q1 annualized: \$19.2B  $\rightarrow$  ~50x
- H1 annualized: \$31B  $\rightarrow$  ~31x
- Run-rate: \$47B  $\rightarrow$  ~20x
  - *Run rate: annualizes the most recent period's revenue (e.g., latest month  $\times$  12) to project a full-year revenue — not actual trailing revenue*

# Sourcing Company Data From the Internet

- Stock exchange & regulatory filings
  - NSE, BSE company disclosures; SEBI and MCA filings — financials are filed in XBRL, a structured, tagged format
- Financial data aggregators built for Indian equities
  - Screener.in, Moneycontrol, Trendlyne, ACE Equity, Capitaline
- Company-published sources
  - Investor relations pages: annual reports, quarterly results, investor presentations
- Institutional-grade data providers
  - Bloomberg, Refinitiv, CMIE Prowess — for cross-checking and longer history

| Maruti Suzuki India Limited | 2024      | 2025    |      | IND-AS         | Consolidated       | <a href="#">26-SEP-2025 17:22:20</a> |

Use any XBRL-to-Excel converter:

1. <https://products.aspose.app/finance/conversion/xbml-to-xlsx>
2. Alternatively, drag the XBRL file to Excel, and read it as XML Table while directing reading from Excel

# Forecasting Revenue: Don't just grow last year's number

- Naive method: last year's revenue  $\times$  (1 + growth rate)
- Hides what's driving the number
  - **Build the driver, don't guess the output**
- Break revenue into real components first
- Project each component on its own driver

## Example: how Anthropic makes money

# Example: Anthropic's revenue break-up

- Revenue in 2026: \$42,560M total
- API & cloud 72.8%, Claude Code 11.3%, enterprise 9.3%, consumer 4.2%, other 2.3%

| Base-case 2026 revenue mix |          |       |
|----------------------------|----------|-------|
| Revenue stream             | Revenue  | Mix   |
| API & cloud consumption    | \$31,000 | 72.8% |
| Claude Code                | \$4,800  | 11.3% |
| Enterprise subscriptions   | \$3,960  | 9.3%  |
| Consumer subscriptions     | \$1,800  | 4.2%  |
| Other partnerships         | \$1,000  | 2.3%  |

# Questions to ask while projecting revenue

- Model pricing, efficiency gains
- Competition: OpenAI, Google Gemini, Chinese Models (many are open-weights)
- DoD dispute: several billion in 2026 revenue at risk
  - Pentagon threatened to classify Anthropic as a “supply-chain risk,” jeopardizing its \$200 million defense contract and forcing all contractors to cut ties.

# Example: Anthropic's Revenue

- Billed token volume × realized blended price

| Revenue stream           | Revenue         | Mix           |
|--------------------------|-----------------|---------------|
| API & cloud consumption  | \$31,000        | 72.8%         |
| Claude Code              | \$4,800         | 11.3%         |
| Enterprise subscriptions | \$3,960         | 9.3%          |
| Consumer subscriptions   | \$1,800         | 4.2%          |
| Other partnerships       | \$1,000         | 2.3%          |
| <b>Total revenue</b>     | <b>\$42,560</b> | <b>100.0%</b> |

| Driver / revenue stream                          | 2026E    | Consumer subscriptions                |         |
|--------------------------------------------------|----------|---------------------------------------|---------|
| API & cloud consumption                          |          | Paid subscribers (millions)           | 5.0     |
| Billed token-equivalent volume (trillion tokens) | 3,100.0  | Subscriber growth                     |         |
| Token-volume growth                              |          | Monthly ARPU (\$)                     | \$30.00 |
| Realized blended price (\$/MTok)                 | \$10.00  | ARPU growth                           |         |
| Realized-price change                            |          | Consumer subscription revenue (\$M)   | \$1,800 |
| API & cloud revenue (\$M)                        | \$31,000 |                                       |         |
| Claude Code                                      |          | Enterprise subscriptions — non-usage  |         |
| Paid seat equivalents (millions)                 | 3.2      | Paid seats (millions)                 | 6.0     |
| Seat growth                                      |          | Seat growth                           |         |
| Monthly ARPU (\$)                                | \$125.00 | Monthly ARPU (\$)                     | \$55.00 |
| ARPU growth                                      |          | ARPU growth                           |         |
| Claude Code revenue (\$M)                        | \$4,800  | Enterprise subscription revenue (\$M) | \$3,960 |

# Build Scenarios

- Not a label like “optimistic” or “pessimistic”
- A specific set of driver values
- Each driver: a different value per scenario

# Three Scenarios for Anthropic's Valuation

**Prompt used:** “Model Anthropic’s valuation using a DCF approach. Provide three scenarios — bear, base, bull — with distinct assumptions for revenue growth rate, margin trajectory, discount rate (WACC), and terminal growth rate.”

| Driver                     | Bear Case                                | Base Case                                  | Bull Case                                         |
|----------------------------|------------------------------------------|--------------------------------------------|---------------------------------------------------|
| Revenue growth (3-yr CAGR) | ~30% — growth decelerates sharply        | ~45% — growth cools but stays strong       | ~65% — enterprise & coding demand compounds       |
| Margin trajectory          | Stays negative on elevated compute costs | Narrows toward breakeven by ~2028          | Turns solidly positive as scale economics kick in |
| Discount rate (WACC)       | ~14% — higher risk premium               | ~11% — in line with high-growth tech peers | ~9% — lower risk premium as leadership solidifies |
| Terminal growth rate       | ~2.5% — converges to GDP-like growth     | ~3.5% — durable AI infrastructure demand   | ~4.5% — AI becomes a larger share of IT spend     |

## Anthropic: Risk Scenarios

| Driver                     | Bear Case                                          | Base Case                                                       | Bull Case                                               |
|----------------------------|----------------------------------------------------|-----------------------------------------------------------------|---------------------------------------------------------|
| DoD case outcome           | Designation upheld — loses federal/defense channel | Case narrows — core commercial business unaffected              | Anthropic wins — designation lifted                     |
| GPU availability           | Compute stays scarce, squeezes training budget     | Supply eases via custom silicon (TPU, Trainium)                 | Ample, diversified compute via multi-cloud deals        |
| Chinese competition        | Frontier open models undercut pricing globally     | Chinese models compete on cost; Anthropic keeps enterprise edge | Western enterprises stay locked out on security grounds |
| Revenue (FY2027E)          | ~\$90–110B                                         | ~\$150–180B                                                     | ~\$220–260B                                             |
| Operating margin (FY2027E) | -15% to -25%                                       | -5% to 0%                                                       | +10% to +15%                                            |

# Example: Anthropic's scenarios

- Bear: 2,600 trillion tokens, \$8.75/MTok
- Base: 3,100 trillion tokens, \$10.00/MTok
- Bull: 3,600 trillion tokens, \$10.50/MTok

## Anthropic Revenue Model — Scenario Inputs

*Blue-font cells are editable assumptions. Yellow cells are the most uncertain 2026 starting points. All monetary outputs are USD millions unless noted.*

| Revenue stream          | Driver / assumption                                   | Bear    | Base     | Bull     | Basis              | Source / modeling note                                                                                      |
|-------------------------|-------------------------------------------------------|---------|----------|----------|--------------------|-------------------------------------------------------------------------------------------------------------|
| API & cloud consumption | 2026 billed token-equivalent volume (trillion tokens) | 2,600.0 | 3,100.0  | 3,600.0  | Analyst assumption | Absolute company-wide token volume is not disclosed; calibrated against observed revenue anchors.           |
| API & cloud consumption | 2026 realized blended price (\$ per MTok)             | \$8.75  | \$10.00  | \$10.50  | Analyst assumption | List pricing varies by model, input/output mix, caching and cloud channel. This is a realized blended rate. |
| API & cloud consumption | 2027 token-volume growth                              | 35.0%   | 50.0%    | 70.0%    | Analyst assumption | Volume growth is separated from price/mix change.                                                           |
| API & cloud consumption | Annual change in token-volume growth                  | (7.0%)  | (9.0%)   | (11.0%)  | Analyst assumption | Percentage-point annual deceleration.                                                                       |
| API & cloud consumption | Minimum token-volume growth                           | 8.0%    | 10.0%    | 15.0%    | Analyst assumption | Long-run floor through the explicit forecast period.                                                        |
| API & cloud consumption | Annual realized-price change                          | (8.0%)  | (5.0%)   | (3.0%)   | Analyst assumption | Captures model price compression, mix and efficiency.                                                       |
| Claude Code             | 2026 paid seat equivalents (millions)                 | 2.2     | 3.2      | 4.2      | Analyst assumption | Calibrated to the disclosed >\$2.5B annualized revenue in Feb 2026 and subsequent growth.                   |
| Claude Code             | 2026 monthly ARPU (\$)                                | \$95.00 | \$125.00 | \$145.00 | Analyst assumption | Blended individual and enterprise-equivalent revenue per paid seat.                                         |
| Claude Code             | 2027 seat growth                                      | 35.0%   | 55.0%    | 80.0%    | Analyst assumption | Business subscriptions reportedly quadrupled early in 2026; forecast assumes rapid deceleration.            |
| Claude Code             | Annual change in seat growth                          | (7.0%)  | (10.0%)  | (13.0%)  | Analyst assumption | Percentage-point annual deceleration.                                                                       |
| Claude Code             | Minimum seat growth                                   | 8.0%    | 10.0%    | 15.0%    | Analyst assumption | Long-run floor through 2031.                                                                                |
| Claude Code             | Annual ARPU growth                                    | -       | 2.0%     | 4.0%     | Analyst assumption | Captures enterprise mix and product depth.                                                                  |

# Forecasting Expenses

| Cost area            | Driver / assumption                           | Bear    | Base    | Bull    | Modeling note                                                                               |
|----------------------|-----------------------------------------------|---------|---------|---------|---------------------------------------------------------------------------------------------|
| Inference / delivery | 2026 cash inference cost (\$ per MTok)        | \$7.00  | \$6.50  | \$6.00  | Includes cloud capacity, accelerators, electricity and networking used to serve API demand. |
| Inference / delivery | Annual inference cost-per-token change        | (12.0%) | (18.0%) | (24.0%) | Efficiency improves through hardware, software, batching, caching and utilization.          |
| Inference / delivery | Non-API delivery cost as % non-API revenue    | 15.0%   | 12.0%   | 10.0%   | Covers product hosting, support and distribution for Claude Code and subscriptions.         |
| Inference / delivery | Support and safety delivery cost as % revenue | 3.0%    | 2.5%    | 2.0%    | Recurring reliability, monitoring and customer-serving safety costs.                        |

## **Example: Maruti's business**

- Volume mix: small car, SUV, premium
- SUV +44.6%, premium +28%
- Royalty to Suzuki Motor Corp: 5–6% of net sales

## Example: Maruti's Revenue

- Domestic volume × blended realization

| Base Scenario                 |         |         |         |         |         |
|-------------------------------|---------|---------|---------|---------|---------|
| Driver / revenue stream       | FY27E   | FY28E   | FY29E   | FY30E   | FY31E   |
| <b>Domestic</b>               |         |         |         |         |         |
| Volume (thousand units)       | 2,136.0 | 2,328.2 | 2,507.5 | 2,668.0 | 2,804.1 |

## Maruti Suzuki Revenue Model — Scenario Inputs

Blue-font cells are editable assumptions. Yellow cells are the most uncertain FY27 starting points. Volumes in thousand units, realization in ₹ lakh/unit unless noted.

| Revenue stream              | Driver / assumption                          | Bear  | Base  | Bull  | Basis                           | Source / modeling note                                                                                                                                   |
|-----------------------------|----------------------------------------------|-------|-------|-------|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Domestic                    | FY27E volume (thousand units, annualized)    | 1,950 | 2,136 | 2,260 | Analyst assumption (annualized) | Q1 FY27 domestic wholesale >534,000 units × 4; point-in-time annualization, not a confirmed full-year actual.                                            |
| Domestic                    | FY28E volume growth                          | 5.0%  | 9.0%  | 14.0% | Analyst assumption              | Q1 FY27 domestic growth was 33% YoY off an easy prior-year base; assumes normalization.                                                                  |
| Domestic                    | Annual change in volume growth               | -1.0% | -1.3% | -1.6% | Analyst assumption              | Percentage-point annual deceleration.                                                                                                                    |
| Domestic                    | Minimum volume growth                        | 3.0%  | 5.0%  | 7.0%  | Analyst assumption              | Long-run floor through FY31.                                                                                                                             |
| Domestic                    | FY27E blended realization (₹ lakh/unit)      | 8.10  | 8.52  | 8.90  | Derived from disclosed revenue  | Consolidated Q1 FY27 revenue (₹ 52,469.8cr) ÷ estimated Q1 total volume (~616,000 units — see Source Data).                                              |
| Domestic                    | Annual realization growth                    | 1.0%  | 3.0%  | 5.0%  | Analyst assumption              | Mix shift toward SUV/premium (SUV +44.6%, premium +28% in Q1 FY27) and pricing power.                                                                    |
| Exports                     | FY27E volume (thousand units, estimated)     | 240   | 290   | 335   | Analyst assumption (estimated)  | Export units not separately disclosed by Maruti. Anchored to FY24's export share (~13.3% of total volume), grown at the disclosed +28.6% YoY rate.       |
| Exports                     | FY28E volume growth                          | 8.0%  | 14.0% | 20.0% | Analyst assumption              | Global demand, new export models (e.g. flex-fuel variants).                                                                                              |
| Exports                     | Annual change in volume growth               | -1.5% | -2.0% | -2.5% | Analyst assumption              | Percentage-point annual deceleration.                                                                                                                    |
| Exports                     | Minimum volume growth                        | 3.0%  | 5.0%  | 8.0%  | Analyst assumption              | Long-run floor through FY31.                                                                                                                             |
| Exports                     | Annual realization growth                    | 1.0%  | 3.0%  | 5.0%  | Analyst assumption              | Maruti does not disclose a domestic/export price differential; same per-unit trend applied as domestic.                                                  |
| Memo (not in revenue build) | Royalty to Suzuki Motor Corp, % of net sales | 5.0%  | 5.5%  | 6.0%  | Historical disclosed range      | Rupee-denominated since 2023. A deduction affecting minority-shareholder value, not a reduction to reported revenue — shown for governance context only. |

# Audit before you submit

- A finished-looking valuation can still be wrong
- Check every number against its source
- Find the error, explain it, fix it
